

Laboratory of development and production of prototype electronics

The laboratory is dedicated to the development and production of prototype electronic. The laboratory also have the necessary equipment and facilities for the complete process of development and production of prototype electronics from software to PCB design, through milling equipment for prototype production of printed circuit board, mounting equipment, equipment for baking components on printed circuit board up to an extensive set of different devices for resuscitation and testing of prototype electronics within given research task.

Technology for the development of technologies and materials for new elements and sensors in traffic and production infrastructure
