

SMART CITY

Nowadays, more and more people live in cities. Up to 70% of the population is expected to live in cities by 2050. In addition, people living in cities consume an ever-increasing share of resources compared to the rural population. The aim of the Smart City concept is to make cities competitive on the one hand and able to cope with technological and economic change, and on the other hand to be sustainable, and to make city dwellers happier with life.

Technology for research and development of optimization algorithms for traffic analysis system and for road traffic management
